Chirala.

Signature of the External

Signature of the Internal

Principal
Y.A. Govt. Degree College for Women
CHIRALA, Praksam Dist., (A.P.)

ACKNOWLEDGEMENT

I sincerely thank the following distinguished personalities who have given their advice and support for successful completion of this work.

I would like to thank **Smt. Dr. CH. RAMANAMMA**, Principal, **Y.A. Govt. Degree College for Women**, Chirala, for providing the Online Resources and allowed to carry out this Work.

I Extend my Sincere thanks to **Smt. N. RAJYA LAKSHMI**, Head of the Dept. for her kind Co-operation and providing the Required resources.

I am very thankful to my project guide **Sri. M. MABU JOHNY** Asst. Professor, Dept. of computer Science, **Y.A. Govt. Degree College for Women, Chirala**, for his Co-operation and inspiring guidance and immense help during the course of Project.

I Extend our Sincere thank to all other teaching and non-teaching staff of the department and who helped directly or indirectly for their co-operation and encouragement.

This Project is a proud presentation of my work to the greatness of our professors and friends who have encouraged me all through the duration of project.

P. ANUHYA(Y193016085)

DECLARATION

This is to state that the dissertation titled **“INTEREST CALCULATION SYSTEM FOR RETAIL BANKING”** carried out at the Department of Computer Science, Y.A. Govt. Degree College for Women, Chirala is based on the original work carried by me under the guidance of **Sri. P. MABU JOHNY Asst. Professor** towards the partial fulfillment of requirements for award of **B.Sc.** This Project work has not been submitted to any other University or Institution either in part or full towards any other degree up to my knowledge and belief.

Date:

Project Associates:

ABSTRACT

Gramina bank located in Hyderabad. The bank has large number of customers doing transactions daily. The transaction may include depositing the amount, withdrawing the amount and etc. As the customer has amount in his account, the bank has to provide interest to the customer. Presently the employees of the bank are using the simple excel sheet to calculate the interest for each customer based on the amount available in the account. The employees are facing lot of problems to do the aforesaid and it is leading to enormous errors. To overcome this problem the bank has planned to have their own package. The task of developing the package to the bank has been entrusted to VERVE SOFTWARE SOLUTIONS.

The VERVE SOFTWARE SOLUTIONS includes the following tasks to be done

- Creating new account to the costumer
- Facility to deposit & withdraw the amount from the account.
- Daily calculating the interest for each customer based on the amount available in the account and account type and maintaining it separately.
- Generating various number of reports as per the requirement of the bank.

CHAPTER -1

INTRODUCTION

1.1 Background

Gramina bank located in Hyderabad. The bank has large number of customers doing transactions daily. The transaction may include depositing the amount, withdrawing the amount and etc. As the customer has amount in his account, the bank has to provide interest to the customer. Presently the employees of the bank are using the simple excel sheet to calculate the interest for each customer based on the amount available in the account. The employees are facing lot of problems to do the aforesaid and it is leading to enormous errors. To overcome this problem the bank has planned to have their own package. The task of developing the package to the bank has been entrusted to VERVE SOFTWARE SOLUTIONS.

The VERVE SOFTWARE SOLUTIONS includes the following tasks to be done

- Creating new account to the customer
- Facility to deposit & withdraw the amount from the account.
- sin the account and account type and maintaining it separately.
- Generating various number of reports as per the requirement of the bank.

Overview of Verve Software Solutions:

Verve Software Solutions is an IT solution provider for a dynamic environment where business and technology strategies converge. Their approach focuses on new ways of business combining IT innovation and adoption while also leveraging an organization's current IT assets. Their work with large global corporations and new products or services and to implement prudent business and technology strategies in today's environment.

VERVE'S RANGE OF EXPERTISE INCLUDES:

- Software Development Services
- Engineering Services
- Systems Integration
- Customer Relationship Management
- Product Development
- Electronic Commerce
- Consulting
- IT Outsourcing

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

1.2 Existing System

The existing interest calculating system for retail banks provides limited options for employees of the bank department but there is a limit to calculate complete interest calculation for number of accounts. In this system all the data is maintained mostly manual and in Excel sheets.

Limitations in the existing System

- Maintaining the data in excel sheets and files is very hard to remember the file names in which the required data is feed.
- No easy access to the required queries.
- Data redundancy, inconsistency, lot of human work need to be done in order analyze the details present in the excel sheets. It leads to wastage of time.
- The data security and data accessing is very slow.

1.3 Proposed System

The system developed should calculate interest daily for each account having balance more than zero at the correct interest rate. This interest calculated will be cumulatively stored in a table which will be updated every day. Remember that the balance on which interest is calculated daily will change because the customer may deposit or withdraw money. This overcomes the limitations which are there in the existing system.

1.4 Team Setup

The organization has formed a group of programmers with one project manager, one senior programmer and a trainee to solve the problem. I have taken part in some aspects of the project i.e. designing and coding few interfaces including documentation and preparing user manuals.

CHAPTER -2

SYSTEM ANALYSIS

2.1 Conversion of the statement of problem to the computerized solutions:

To manage the Operations in Interest calculating panel and maintain the data of the process is a big deal. Find out the daily transactions and calculate daily as well as monthly interest for particular account. Maintain complete information of accounts reports and selected accounts reports.

Modules:

Admin users - Has full access to all the modules of this system. Responsible for the accounting of all cash collections and remittances. Prepares and submits also Daily Deposit Reports, petty cash replenishment, and Cashier's Accountability Report.

2.2. Development Environment:

2.2.1. Hardware Specification:

- Processor Intel Pentium III or higher
- 128 MB RAM or more
- 20 GB Hard Disk or more
- Monitor
- 104 Keyboard
- Logitech Mouse
- Floppy Disk Drive 1.44 MB

2.2.2. Software Specifications:

Operating System	:	Linux or Windows-XP
GUI	:	JSP and HTML.
Database Server	:	Oracle 8i.

2.3. Execution Environment:

CLIENT SIDE:

Operating System	:	Linux or Windows-XP
Web Client	:	Internet explorer 6.0

SERVER SIDE:

Operating System	:	Linux or Windows-XP
Web Server	:	Apache Tomcat 5.0 and Above.
Back-End	:	ORACLE 8i

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

2.4 Diagrams:

Unified Modeling Language:

The Unified Modeling Language allows the software engineer to express an analysis model using the modeling notation that is governed by a set of syntactic semantic and pragmatic rules.

A UML system is represented using five different views that describe the system from distinctly different perspective. Each view is defined by a set of diagram, which is as follows.

- User Model View
 1. This view represents the system from the users perspective.
 2. The analysis representation describes a usage scenario from the end-users perspective.
 3. Structural model view
 4. In this model the data and functionality are arrived from inside the system.
 5. This model view models the static structures.
 6. Behavioral Model View

It represents the dynamic of behavioral as parts of the system, depicting the interactions of collection between various structural elements described in the user model and structural model view.

- Implementation Model View

In this the structural and behavioral as parts of the system are represented as they are to be built.

- Environmental Model View

In this the structural and behavioral aspects of the environment in which the system is to be implemented are represented.

UML is specifically constructed through two different domains they are:

- UML Analysis modeling, this focuses on the user model and structural model views

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

of the system.

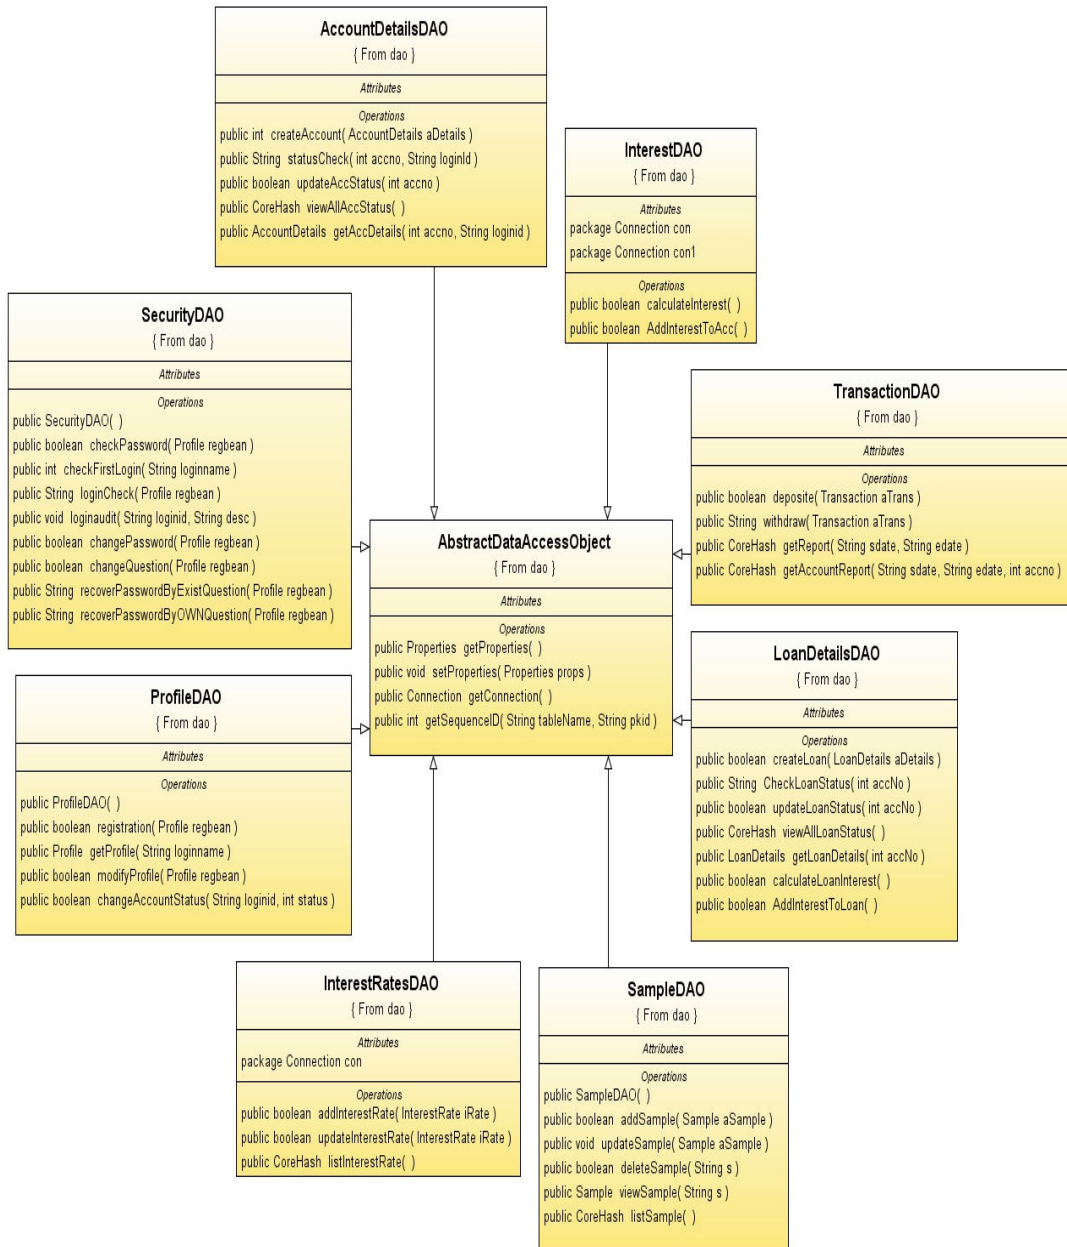

- UML design modeling, which focuses on the behavioral modeling, implementation modeling and environmental model views.

Use case Diagrams represent the functionality of the system from a user's point of view. Use cases are used during requirements elicitation and analysis to represent the functionality of the system. Use cases focus on the behavior of the system from external point of view.

Actors are external entities that interact with the system. Examples of actors include users like administrator, bank customer ...etc., or another system like central database.

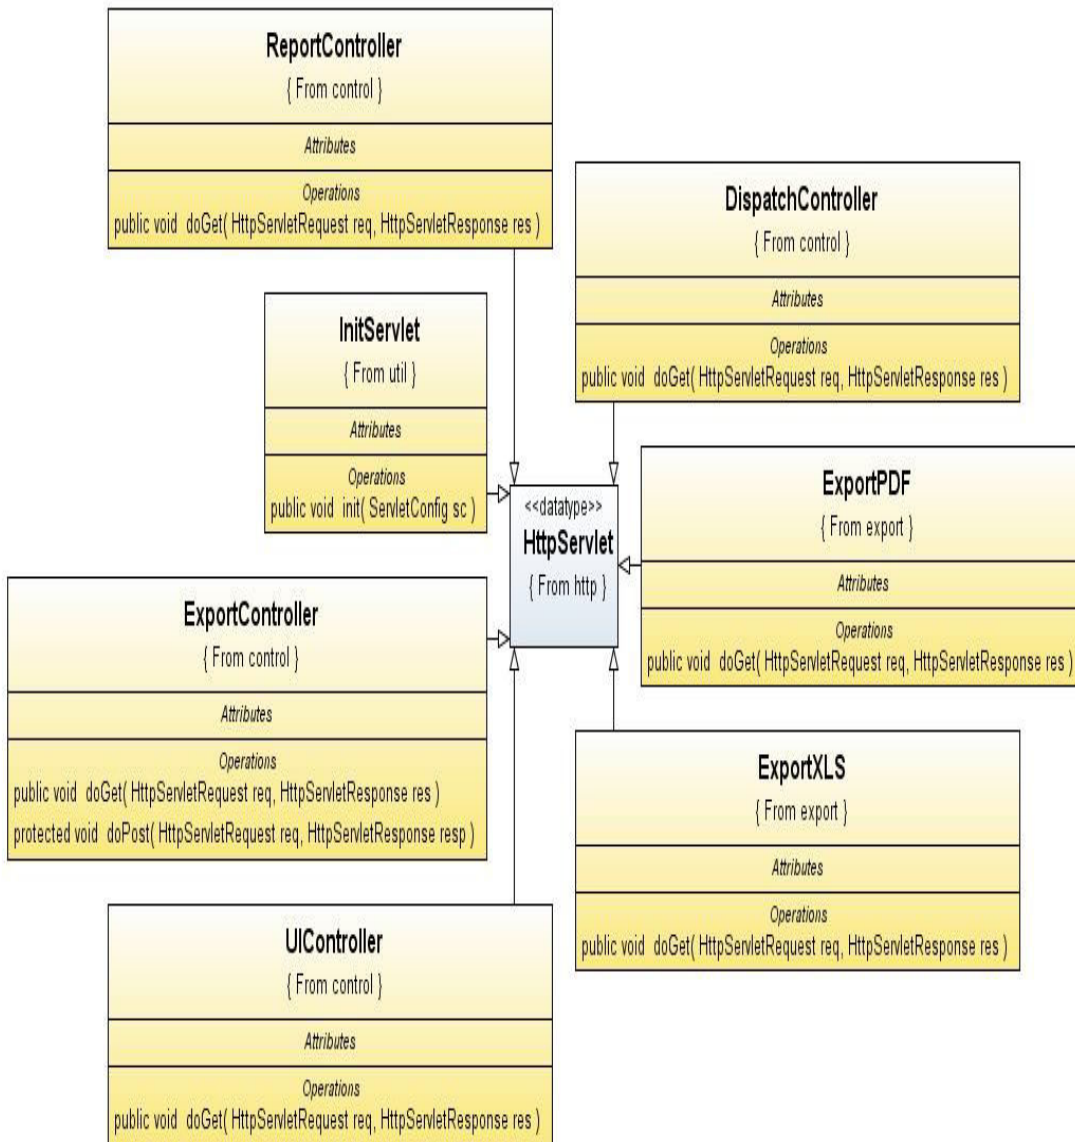

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

2.6. Description of the Interfaces

General Description:

Product perspective

The scientific certification system keeps track of all the information of organizations received and verifies and certifies them and provides ranking to the companies .

Software Interfaces

Scientific certification system is a web-based application developed using software interfaces used as JSP, HTML. Through JDBC there is a possibility to communicate with the database application.

Hardware Interfaces

This describes the hardware configuration on which our Application is being built. The hardware interfaces used are-

Hard Disk	:	80GB
RAM	:	512
Processor	:	Pentium-III 800 GHz or more
Monitor	:	15inches LG

Optical Mouse

Communication Interfaces

Through JDBC drivers our Application communicates with the Database.

User Interfaces

Admin has the authentication to add details of company, product, project etc and can know the information about company details and view details in the form of reports.

The STPI admin provides certification to the organizations.

3.4 TESTING

The tester attempts Software Testing is the process used to help identify the correctness, completeness, security, and quality of developed computer software. Testing is a process of technical investigation, performed on behalf of stakeholders, that is intended to reveal quality-related information about the product with respect to the context in which it is intended to operate. This includes, but is not limited to, the process of executing a program or application with the intent of finding errors. Quality is not an absolute; it is value to some person. With that in mind, testing can never completely establish the correctness of arbitrary computer software; testing furnishes a criticism or comparison that compares the state and behavior of the product against a specification. An important point is that software testing should be distinguished from the separate discipline of Software Quality Assurance (SQA), which encompasses all business process areas, not just testing.

There are many approaches to software testing, but effective testing of complex products is essentially a process of investigation, not merely a matter of creating and following routine procedure. One definition of testing is "the process of questioning a product in order to evaluate it", where the "questions" are operations thto execute with the product, and the product answers with its behavior in reaction to the probing of the tester[citation needed]. Although most of the intellectual processes of testing are nearly identical to that of review or inspection, the word testing is connoted to mean the dynamic analysis of the product—putting the product through its paces. Some of the common quality attributes include capability, reliability, efficiency, portability, maintainability, compatibility and usability. A good test is sometimes described as one which reveals an error; however, more recent thinking suggests that a good test is one which reveals information of interest to someone who matters within the project community.

Introduction

In general, software engineers distinguish software faults from software failures. In case of a failure, the software does not do what the user expects. A fault is a programming error that may or may not actually manifest as a failure. A fault can also be described as an error in the correctness of the semantic of a computer program. A fault will become a failure if the exact computation conditions are met, one of them being that the faulty portion of computer software executes on the CPU. A fault can also turn into a failure when the software is ported to a different hardware platform or a different compiler, or when the software gets extended.

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

Software testing is the technical investigation of the product under test to provide stakeholders with quality related information.

Software testing may be viewed as a sub-field of Software Quality Assurance but typically exists independently (and there may be no SQA areas in some companies). In SQA, software process specialists and auditors take a broader view on software and its development. They examine and change the software engineering process itself to reduce the amount of faults that end up in the code or deliver faster.

Regardless of the methods used or level of formality involved the desired result of testing is a level of confidence in the software so that the organization is confident that the software has an acceptable defect rate. What constitutes an acceptable defect rate depends on the nature of the software. An arcade video game designed to simulate flying an airplane would presumably have a much higher tolerance for defects than software used to control an actual airliner.

A problem with software testing is that the number of defects in a software product can be very large, and the number of configurations of the product larger still. Bugs that occur infrequently are difficult to find in testing. A rule of thumb is that a system that is expected to function without faults for a certain length of time must have already been tested for at least that length of time. This has severe consequences for projects to write long-lived reliable software.

A common practice of software testing is that it is performed by an independent group of testers after the functionality is developed but before it is shipped to the customer. This practice often results in the testing phase being used as project buffer to compensate for project delays. Another practice is to start software testing at the same moment the project starts and it is a continuous process until the project finishes.

Another common practice is for test suites to be developed during technical support escalation procedures. Such tests are then maintained in regression testing suites to ensure that future updates to the software don't repeat any of the known mistakes.

It is commonly believed that the earlier a defect is found the cheaper it is to fix it.

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

<u>Time Introduced</u>	<u>Time Detected</u>				
	<u>Requirements</u>	<u>Architecture</u>	<u>Construction</u>	<u>System Test</u>	<u>Post-Release</u>
Requirements	1	3	5-10	10	10-100
Architecture	-	1	10	15	25-100
Construction	-	-	1	10	10-25

In counterpoint, some emerging software disciplines such as extreme programming and the agile software development movement, adhere to a "test-driven software development" model. In this process unit tests are written first, by the programmers (often with pair programming in the extreme programming methodology). Of course these tests fail initially; as they are expected to. Then as code is written it passes incrementally larger portions of the test suites. The test suites are continuously updated as new failure conditions and corner cases are discovered, and they are integrated with any regression tests that are developed. Unit tests are maintained along with the rest of the software source code and generally integrated into the build process (with inherently interactive tests being relegated to a partially manual build acceptance process). The software, tools, samples of data input and output, and configurations are all referred to collectively as a test harness.

White-box and black-box testing:

To meet Wikipedia's quality standards, this section may require cleanup. Please discuss this issue on the talk page, and/or replace this tag with a more specific message.

White box and black box testing are terms used to describe the point of view a test engineer takes when designing test cases. Black box being an external view of the test object and white box being an internal view. Software testing is partly intuitive, but largely systematic. Good testing involves much more than just running the program a few times to see whether it works. Thorough analysis of the program under test, backed by a broad knowledge of testing techniques and tools are prerequisites to systematic testing.

Software Testing is the process of executing software in a controlled manner; in order to answer the question "Does this software behave as specified?" Software testing is used in association with Verification and Validation. Verification is the checking of or testing of items, including software, for conformance and consistency with an associated specification. Software

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

testing is just one kind of verification, which also uses techniques as reviews, inspections, walk-through. Validation is the process of checking what has been specified is what the user actually wanted.

- Validation: Are we doing the right job?
- Verification: Are we doing the job right?

In order to achieve consistency in the Testing style, it is imperative to have and follow a set of testing principles. This enhances the efficiency of testing within SQA team members and thus contributes to increased productivity. The purpose of this document is to provide overview of the testing, plus the techniques.

At SDEI, 3 levels of software testing is done at various SDLC phases

- Unit Testing: in which each unit (basic component) of the software is tested to verify that the detailed design for the unit has been correctly implemented
- Integration testing: in which progressively larger groups of tested software components corresponding to elements of the architectural design are integrated and tested until the software works as a whole.
- System testing: in which the software is integrated to the overall product and tested to show that all requirements are met

A further level of testing is also done, in accordance with requirements:

- Acceptance testing: upon which the acceptance of the complete software is based. The clients often do this.
- Regression testing: is used to refer the repetition of the earlier successful tests to ensure that changes made in the software have not introduced new bugs/side effects.

In recent years the term grey box testing has come into common usage. The typical grey box tester is permitted to set up or manipulate the testing environment, like seeding a database, and can view the state of the product after his actions, like performing a SQL query on the database to be certain of the values of columns. It is used almost exclusively of client-server testers or

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

others who use a database as a repository of information, but can also apply to a tester who has to manipulate XML files (DTD or an actual XML file) or configuration files directly. It can also be used of testers who know the internal workings or algorithm of the software under test and can write tests specifically for the anticipated results. For example, testing a data warehouse implementation involves loading the target database with information, and verifying the correctness of data population and loading of data into the correct tables.

Test levels

- Unit testing tests the minimal software component and sub-component or modules by the programmers.
- Integration testing exposes defects in the interfaces and interaction between integrated components (modules).
- Functional testing tests the product according to programmable work.
- System testing tests an integrated system to verify/validate that it meets its requirements.
- Acceptance testing testing can be conducted by the client. It allows the end-user or customer or client to decide whether or not to accept the product. Acceptance testing may be performed after the testing and before the implementation phase. See also Development stage

Alpha testing is simulated or actual operational testing by potential users/customers or an independent test team at the developers' site. Alpha testing is often employed for off-the-shelf software as a form of internal acceptance testing, before the software goes to beta testing.

Beta testing comes after alpha testing. Versions of the software, known as beta versions, are released to a limited audience outside of the company. The software is released to groups of people so that further testing can ensure the product has few faults or bugs.

It should be noted that although both Alpha and Beta are referred to as testing it is in fact use emersion. The rigors that are applied are often unsystematic and many of the basic tenets of testing process are not used. The Alpha and Beta period provides insight into environmental and utilization conditions that can impact the software.

INTEREST CALCULATION SYSTEM FOR RETAIL BANKING

After modifying software, either for a change in functionality or to fix defects, a regression test re-runs previously passing tests on the modified software to ensure that the modifications haven't unintentionally caused a regression of previous functionality. Regression testing can be performed at any or all of the above test levels. These regression tests are often automated.

Test cases, suites, scripts and scenarios A test case is a software testing document, which consists of event, action, input, output, expected result and actual result. Clinically defined (IEEE 829-1998) a test case is an input and an expected result. This can be as pragmatic as 'for condition x your derived result is y', whereas other test cases described in more detail the input scenario and what results might be expected. It can occasionally be a series of steps (but often steps are contained in a separate test procedure that can be exercised against multiple test cases, as a matter of economy) but with one expected result or expected outcome. The optional fields are a test case ID, test step or order of execution number, related requirement(s), depth, test category, author, and check boxes for whether the test is automatable and has been automated. Larger test cases may also contain prerequisite states or steps, and descriptions. A test case should also contain a place for the actual result. These steps can be stored in a word processor document, spreadsheet, database or other common repository. In a database system, you may also be able to see past test results and who generated the results and the system configuration used to generate those results. These past results would usually be stored in a separate table.

The term test script is the combination of a test case, test procedure and test data. Initially the term was derived from the byproduct of work created by automated regression test tools. Today, test scripts can be manual, automated or a combination of both.

The most common term for a collection of test cases is a test suite. The test suite often also contains more detailed instructions or goals for each collection of test cases. It definitely contains a section where the tester identifies the system configuration used during testing. A group of test cases may also contain prerequisite states or steps, and descriptions of the following test.

Collections of test cases are sometimes incorrectly termed a test plan. They might correctly be called a test specification. If sequence is specified, it can be called a test script, scenario or procedure.

A sample testing cycle

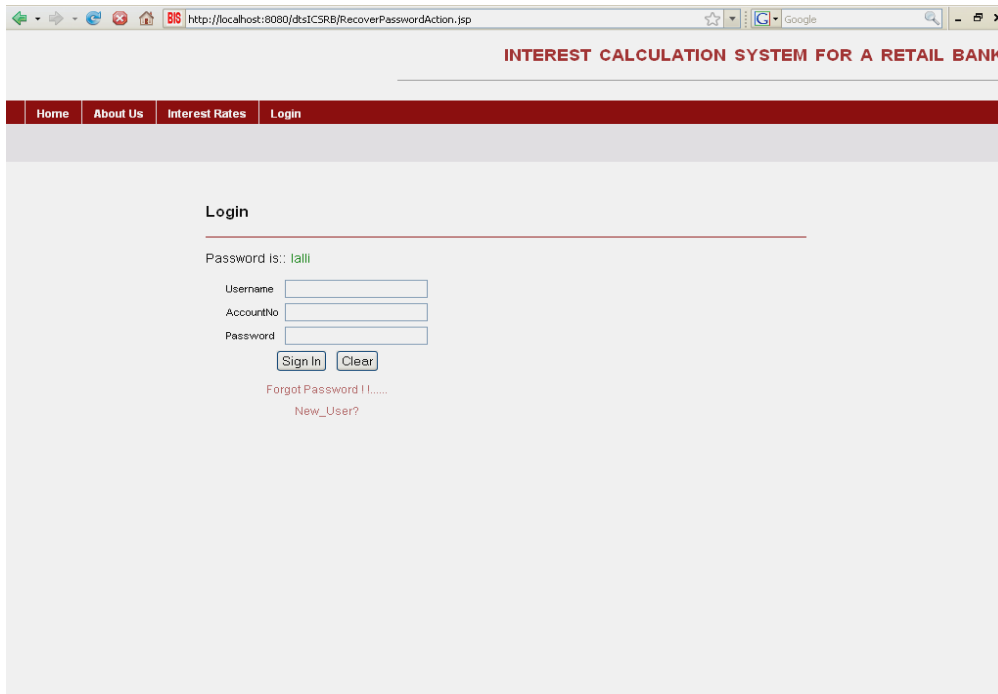

Although testing varies between organizations, there is a cycle to testing:

1. Requirements Analysis: Testing should begin in the requirements phase of the software development life cycle. During the design phase, testers work with developers in determining what aspects of a design are testable and under what parameter those tests work.
2. Test Planning: Test Strategy, Test Plan(s), Test Bed creation.
3. Test Development: Test Procedures, Test Scenarios, Test Cases, Test Scripts to use in testing software.
4. Test Execution: Testers execute the software based on the plans and tests and report any errors found to the development team.
5. Test Reporting: Once testing is completed, testers generate metrics and make final reports on their test effort and whether or not the software tested is ready for release.
6. Retesting the Defects

Not all errors or defects reported must be fixed by a software development team. Some may be caused by errors in configuring the test software to match the development or production environment. Some defects can be handled by a workaround in the production environment. Others might be deferred to future releases of the software, or the deficiency might be accepted by the business user. There are yet other defects that may be rejected by the development team (of course, with due reason) if they deem it inappropriate to be called a defect.

5. CONCLUSION

The **Interest Calculating for Retail bank** is a web-based application for primarily providing training to the employees who provide customized solutions to meet organizational needs.

This application software has been computed successfully and was also tested successfully by taking “test cases”. It is user friendly, and has required options, which can be utilized by the user to perform the desired operations.

The software is developed using Java as front end and Oracle as back end in Windows environment. The goals that are achieved by the software are:

- ✓ Instant access.
 - ✓ Improved productivity.
 - ✓ Optimum utilization of resources.
 - ✓ Efficient management of records.
 - ✓ Simplification of the operations.
 - ✓ Less processing time and getting required information.
 - ✓ User friendly.
- Portable and flexible for further enhancement.
